SUMMARY

Full-Stack Software Engineer with 2+ years building production systems in Node.js (NestJS), Golang, React and PostgreSQL on AWS. Currently at Bestfy, a payment gateway that has processed R\$47M+ in transactions, where I ship customer-facing features, harden application security, and tune performance under real load. I also work in Go on lower-level, real-time systems, most recently a **WebRTC SFU** with per-subscriber simulcast layer selection.

EXPERIENCE

Bestfy

Full-Stack Developer

Apr 2026 – Present

Balneário Camboriú, SC, Brazil

- Full-stack development on a payment gateway platform that has processed **R\$47M+ in transactions**, working across NestJS, PostgreSQL, Redis, Docker and AWS.
- Delivered core parts of the **Checkout** feature, letting merchants expose products on public URLs for direct purchase. It is now one of the platform's primary revenue-driving features.
- Built **order-bump** and **abandoned-cart recovery** systems, increasing conversion and average order value.
- Implemented **3D Secure (3DS2)** authentication on the public checkout, from the tokenization flow to backend-enforced validation, reducing fraud and chargeback risk.
- Designed the **Redis-backed** session architecture supporting high-concurrency session management across multiple horizontally scaled application instances.
- Optimized critical **PostgreSQL** queries, cutting response times by up to **2–3 seconds** on key endpoints.
- Hardened the application's **security** posture: audited third-party front-end dependencies, implemented server-side **CSRF** protection and secure cookie configuration (HttpOnly, SameSite Strict/Lax), and integrated Cloudflare Turnstile CAPTCHA to mitigate bot traffic.
- Wrote and maintained **unit tests** with **Jest** and authored **automated end-to-end test scripts** with **Cypress** to guard against regressions in critical flows.
- Built error **observability** into the codebase with a reusable logging adapter that reports handled exceptions to **Sentry**, giving the team real-time visibility into failures in production.
- **Stack:** NestJS, TypeScript, PostgreSQL, Redis, Docker, AWS (EC2, S3, Amplify).

Pináculo Digital

Full-Stack Developer (promoted from Trainee, Sep 2024)

Jun 2024 – Apr 2026

Fortaleza, CE, Brazil

- Built high-performance web applications with **NestJS**, **React**, **SvelteKit** and **Golang**, backed by PostgreSQL and Prisma ORM.
- Contributed to architectural decisions and **led code reviews**, driving Clean Code practices across the team.
- Cut a production search query on a heavily featured search system from **9s to 1.2s** through strategic **indexing** and query analysis.
- Monitored server behavior with **Grafana** and **Prometheus**, using the metrics to pinpoint where load was concentrating and guide optimization work.
- Built a football player management system exposing detailed per-match and per-player statistics (goals, assists, passes), fed continuously by a dedicated **web-scraping microservice**.
- As Trainee (Jun–Sep 2024): delivered frontend features for modern web applications including **SPAs** and **PWAs**, and implemented and integrated **RESTful APIs** with full CRUD functionality.

Calang.io — Junior Enterprise (student-run software company)

Backend Tech Lead

Mar 2025 – Dec 2025

Juazeiro do Norte, CE, Brazil

- Led a junior development team, guiding business-rule interpretation and implementation. Concurrent with the role above.
- Ran regular **code reviews** to accelerate the team's technical growth.
- Managed the development workflow with **Kanban**, organizing and prioritizing incoming demands.

Universidade Federal do Cariri (UFCA)

Research & Development Scholar (DTI)

Jul 2022 – Nov 2023

Juazeiro do Norte, CE, Brazil

- Supported the department's IT and network infrastructure: workstation setup on Windows and Ubuntu, VLAN configuration, and PowerShell automation.

PROJECTS

W-Core — Real-Time State Engine <i>Elixir, OTP, ETS, Phoenix LiveView, SQLite</i>	2026
- Built a real-time telemetry engine for industrial edge computing, ingesting heartbeat events from thousands of sensors without event loss. - Two-layer state architecture: a GenServer writes hot events to ETS on the critical path while a supervised worker performs batched write-behind upserts into SQLite, removing the write-lock bottleneck of the legacy relational design. - Proved resilience with an integration test injecting 10,000 concurrent events, asserting exact event counts, absence of race conditions, and correct persistence sync. Real-time operations dashboard in Phoenix LiveView, pushing status changes over PubSub the instant a machine fails.	
Academic RAG Assistant <i>Golang, PostgreSQL, pgvector</i> dalton02/UFCA-ChatBot	2026
- Built a RAG (retrieval-augmented generation) assistant over the university's academic documents, answering questions about courses, subjects and semesters. - Ingestion pipeline that parses institutional documents, generates embeddings, and stores the vectors in PostgreSQL with pgvector. - At query time, embeds the user's question and retrieves the closest contexts by vector similarity search before generating the answer. Authenticated chat interface shipped as a desktop application with SvelteKit and Tauri.	
WebRTC SFU <i>Golang, WebRTC, Pion, simulcast</i> dalton02/Selective-Forwarding-Unit	2026
- Built a multi-party real-time audio/video SFU server in Go on top of Pion, redistributing participant media streams to optimize bandwidth and compute versus a mesh topology. - Implemented simulcast support: publishers send multiple encodings (480p/720p) and the server selects the appropriate quality layer per subscriber based on connection conditions.	

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Go, Elixir, SQL, C++, Python, HTML, CSS
Backend: Node.js, NestJS, Express, REST APIs, WebSockets, WebRTC, RabbitMQ, BullMQ, JWT Authentication, OAuth2, Swagger/OpenAPI, Microservices
Concurrency & Real-Time: Elixir/OTP (GenServer, Supervisors), ETS, Phoenix LiveView, PubSub, Event-Driven Ingestion
Frontend: React, SvelteKit, SPA, PWA, Tauri, Responsive Design
Databases & Data: PostgreSQL, pgvector, Redis, SQLite, Prisma ORM, Query Optimization, Indexing, Database Modeling
AI & Retrieval: RAG (Retrieval-Augmented Generation), Vector Embeddings, Vector Similarity Search
Testing: Jest, Cypress, Unit Testing, E2E Testing, Test Automation
Observability & Monitoring: Sentry, Grafana, Prometheus, Error Tracking, Metrics, Structured Logging, Production Incident Investigation
Cloud & DevOps: AWS (EC2, S3, Amplify), Docker, Linux, Git, CI/CD, Cloudflare
Security: CSRF Protection, Secure Session Management, Dependency Auditing, CAPTCHA Integration, 3D Secure (3DS2), Fraud Prevention
Practices: Clean Code, Clean Architecture, Code Review, Scrum, Kanban, System Design

EDUCATION

Universidade Federal do Cariri (UFCA)	Sep 2021 – Aug 2026
<i>Bachelor of Science in Computer Science</i>	<i>Juazeiro do Norte, CE, Brazil</i>
E.E.E.P Maria Violeta Arraes de Alencar Gervaiseau	Feb 2018 – Feb 2021
<i>Technical Degree in Computer Networks</i>	<i>Ceará, Brazil</i>

LANGUAGES

English: Professional Working Proficiency		Portuguese: Native
