Summary

Full-stack software engineer with 2+ years of experience, currently focused on payment systems at Bestfy, a gateway that has processed over BRL 47M. Previously, at Pináculo Digital, built video calling for an internal platform on a Go SFU. In parallel, founder and sole engineer of DiligensAI, an AI SaaS in beta.

Experience

Bestfy — Payment Gateway (Fintech) Apr 2026 – Present
Full-Stack Developer *Balneário Camboriú, SC, Brazil*

- Designed the common abstraction behind four external payment gateways, then moved the charge lifecycle, once duplicated in each gateway, into a shared flow, so adding Cielo required only a new adapter.
- Built the external-gateway option as an alternative to the default acquirer: OAuth2 merchant account linking where the gateway supports it, a plan subscription and a per-sale fee accrued to an invoice that closes monthly or when it reaches a set amount.
- Implemented 3D Secure (3DS2) end to end, from the React challenge to backend verification, with Jest tests.
- Developed async third-party API integrations, consuming shipping, order and messaging webhooks and sending GA4/Google Ads conversions, processed in BullMQ queues with backoff retries, idempotency and rate limiting.
- Proposed and implemented the migration from JWT authentication to Redis-backed sessions, enabling immediate revocation and letting users manage their active devices.
- Identified and remediated web vulnerabilities, including missing CSRF protection and cookies without HttpOnly/SameSite, and put bot-exposed endpoints behind Cloudflare Turnstile.

Pináculo Digital — Software House Jun 2024 – Apr 2026
Full-Stack Developer (promoted from Trainee, Sep 2024) *Fortaleza, CE, Brazil*

- Built video calling for an internal platform: an SFU in Go (Pion), WebSocket signaling and per-subscriber simulcast layer selection, replacing a P2P mesh that degraded at 3 or more participants; tested with 12 in one call.
- Built a per-match and per-player soccer stats system, fed by a scraping microservice with proxy rotation around per-IP rate limits and alerts on source-site layout changes.
- Rewrote the player-stats query to aggregate in SQL, cutting profile and ranking load times from 9s to 1.2s.
- Instrumented services with Prometheus metrics and set up Grafana dashboards and alerts.
- As a trainee, developed a SvelteKit editor that rendered AI-generated contracts from JSON as a document, with inline field editing saved back to the backend.

Calang.io — Junior Enterprise (student-run software company) Mar 2025 – Dec 2025
Backend Tech Lead (concurrent with the role above) *Juazeiro do Norte, CE, Brazil*

- Led a backend team of up to 4 people with regular code reviews and a Kanban workflow.

Projects

DiligensAI | *Go, PostgreSQL, Redis, RabbitMQ, SvelteKit, LLM* | app.diligensai.com.br 2026

- AI SaaS (beta) built solo: Go (Gin) API, RabbitMQ worker with DLQ, Svelte admin panel and embeddable SDK.
- LLM agent with tool calling generated from the client's OpenAPI spec; the router, which picks the tool or SQL report for each question, scored 97% on a 71-case eval.
- GitHub Actions CI runs Go tests before blue/green deploys; OpenTelemetry and AES-256-GCM encryption for PII.

Technical Skills

Programming Languages: TypeScript, JavaScript, Go (Golang), SQL
Backend: Node.js, NestJS, Express, Gin, REST APIs, WebSockets, SSE, WebRTC, Microservices, OAuth2
Frontend: React, Svelte/SvelteKit, Tailwind CSS, HTML/CSS
Data & Messaging: PostgreSQL, Redis, Prisma, sqlc, pgvector, RabbitMQ, BullMQ
AI & LLM: LLM Agents, Tool Calling, Anthropic API, RAG, Embeddings, Evals
Testing & Observability: Jest, Go testing, Sentry, Grafana, Prometheus, OpenTelemetry
Cloud & DevOps: AWS (EC2, S3, RDS, ElastiCache, Amplify), Docker, GitHub Actions (CI/CD), Nginx, Linux
Spoken Languages: English (professional working proficiency), Portuguese (native)

Education

Universidade Federal do Cariri (UFCA) Graduated Aug 2026
Bachelor of Science in Computer Science *Juazeiro do Norte, CE, Brazil*
